The Farm Electrical

Of the six and a half million farm homes in this country, only half a million have electricity. Still, the advantages of electricity are widely known. But there is more to farm electricity than the installation of motors, lighting and heaters. Current must be brought to the farm, that means many miles of transmission line, supported by towers, conductors, and adequate generating equipment.

Slowly but surely the electrification of American farms is taking place. As farmers learn how to use electricity, rural service lines reach out farther and farther into open country.

Six million farms to be electrified! Here is a vast and virgin field for the application of electricity, with countless opportunities for college-trained men in the technical and commercial phases of this undertaking. And for the agricultural college student and others planning a future life in rural sections, it means better, bigger, happier life-time now in the making.

By way of service lines bring electricity to the farmer's door, each of these services cost only one cent for every 100 miles of line and one cent for every mile of line.
